

Patient Note

Reason for Visit:

sprained my ankle yesterday while playing basketball

History of Present Illness:

playing in a local rec league game. Jumped to grab a rebound, landed on another player's foot. Right foot rolled outward, sharp pain on the outside of the ankle. About 7 p.m. last night. Started to swell and looked a bit bruised later.

Current Medications:

Over-the-counter ibuprofen. About 400 mg last night and another 400 mg this morning.

Past Medical History:

No medical issues reported.

Surgical History:

Wisdom teeth removed at age 20.

Family History:

None

Allergies:

No known drug allergies. Seasonal allergies in spring.

Hospitalizations / Diagnostics:

None

Review of Systems:

Ankle pain, stiffness when trying to rotate. No numbness or tingling. No fever, chills, or other systemic symptoms.

Vital Signs:

Pain rating 7 when incident happened, now 5-6.

Examination:

Tenderness at anterior talofibular ligament area. Swelling observed. Range of motion: OK up and down, painful side to side.

Assessments:

Likely sprain of the lateral ankle ligaments, most likely the anterior talofibular ligament. Plan for X-ray to rule out fracture.

Patient Note

Procedures:

None

Treatment Plan:

Rest, ice, compression, elevation, limited weight-bearing, possible ankle brace or wrap, and may recommend physical therapy if needed. Continuing icing and keeping the ankle elevated.

Follow-Up (Detailed):

Discuss next steps after confirming no fracture with X-ray results.

Preventive Medicine:

None

Visit Codes:

None

Procedure Codes:

None

Follow-Up (Short):

None

Other Notes:

No reported use of tobacco, alcohol once a week. No recreational drug use.
